SAMRUDDHI S KHUTALE

+91 9763921016 khutalesamruddhi@gmail.com Samruddhi Khutale Kolhapur

OBJECTIVE

Motivated B.Sc. Computer Science graduate with hands-on experience in backend development (Laravel, Spring Boot), cloud infrastructure (AWS, Terraform), and DevOps practices. Seeking an entry-level or internship role where I can contribute to building scalable applications, automate infrastructure, and grow as a full-stack / DevOps engineer.

Technical Skills

Cloud: AWS (EC2, S3, VPC, IAM, ALB, ASG, CloudWatch), GCP, Azure
Infrastructure as Code: Terraform, OpenTofu, Modules, Remote State
Containers: Docker, Docker Compose, Docker Hub
CI/CD: Jenkins, GitHub Actions, Harness
Backend: Laravel, PHP, Python, REST APIs, MySQL
Operating Systems: Linux (Amazon Linux, Ubuntu), Shell Scripting
Version Control: Git, GitHub, GitLab, Bitbucket
Monitoring: Prometheus, Grafana, CloudWatch, PagerDuty
Build & Quality: Maven, SonarQube, Trivy
Scripting: Bash, Python
AI Tools: Generative AI, LLMs

PROJECTS

Multi-Environment 3-Tier AWS Architecture using Terraform

Technologies: Terraform, AWS (EC2, VPC, ALB, ASG, IAM, Security Groups), Amazon Linux 2023, Modules, Bastion Host

- Built a modular 3-tier AWS architecture (Web, App, Database) using Terraform with separate environments (Dev, Test, Prod).
- Created reusable modules for VPC, EC2, Auto Scaling Groups, Application Load Balancers, Launch Templates, Bastion host, and Database.
- Deployed resources on Amazon Linux across public and private subnets with proper security groups and least-privilege access.
- Configured Application Load Balancers for frontend and backend tiers with health checks and Auto Scaling.
- Used remote state, provider versioning, and environment-specific configurations for clean and scalable infrastructure.
- Enabled secure SSH access through a bastion host and isolated the database tier in private subnets.

CI/CD Pipeline using GitHub, Jenkins & Maven

- Built a full-stack application using Java Spring Boot for backend and a separate frontend module.
- Containerized the application using Docker and orchestrated services with Docker Compose.
- Integrated AWS RDS for the database and managed environment configurations with .env files.
- Set up Jenkins pipeline for continuous integration and automated builds.
- Used Maven (pom.xml) for dependency management and created production-ready Docker images.
- Structured the project with clear separation of backend, frontend, compose, and CI/CD folders.

Static Website Hosting AWS (S3 + CloudFront)

Technologies: AWS S3, CloudFront, Route 53, ACM, IAM, Lambda, Nginx

- Hosted a static website on Amazon S3 and used versioning and lifecycle policies to manage files and reduce storage costs.
- Configured CloudFront for faster website delivery worldwide and Route 53 for domain management. Used Origin Access Control (OAC) to allow website access through CloudFront only.

Freelance Laravel Developer

Technologies: Laravel 8, Microservices Architecture, MySQL, REST APIs, Postman, Bitbucket, Jira

- Worked with a client to develop and maintain Laravel 8 REST APIs within a microservices architecture based on business requirements.
- Developed new APIs and enhanced existing logic using scalable, maintainable, and reusable backend solutions.
- Managed MySQL schema changes, including table creation, column modifications, ENUM updates, and database operations.
- Implemented server-side validation, secure data handling, and optimized API responses for reliability and security.
- Performed end-to-end API testing using Postman and maintained structured collections for testing and collaboration.
- Contributed to API documentation to simplify integration and provide developer references.
- Used Bitbucket for version control, commits, branch management, and deployment workflow coordination.
- Tracked development tasks, bug fixes, and progress using Jira within an Agile workflow.
- Collaborated directly with clients to clarify requirements, resolve issues, and deliver features on time.
- Followed coding standards, reusable architecture practices, and debugging techniques during development.

BizTrackr – Electronic Shop Management System

Technologies: Laravel 12 | MySQL | HTML | CSS | Bootstrap 4 | Stripe

- Developed a web-based retail management application for inventory, billing, customer management, and service tracking.
- Implemented role-based access control for Super User, Admin, and Staff roles.
- Built inventory tracking with low-stock alerts and automatic stock updates after sales.
- Developed digital billing with multiple payment modes and database-driven pricing; integrated the Stripe payment gateway.
- Implemented customer purchase history, warranty tracking, returns, replacements, and service reminder notifications.
- Created dashboards and reports to analyze sales trends, inventory status, and business performance.

Walstar Technologies Pvt. Ltd. (Internship Project)

- React.js | Git | Vercel
- Built a responsive collage website using React.js, demonstrating skills in component-based architecture and modern frontend design.
- Implemented dynamic layouts and interactive UI elements using JavaScript, CSS, and React hooks.
- Deployed live on Vercel and maintained version control through Git.
- Live Demo: Link

LEARNING & TECHNICAL EXPOSURE

- Hands-on experience with MySQL database design, schema management, query optimization, and backend integration.
- Exploring Generative AI, LLM integrations, prompt engineering, and AI-powered application development using Python and Jupyter Notebook.
- Good understanding of Linux commands, file permissions, shell scripting, process management, and terminal-based operations.
- Passionate about combining Backend Development, Microservices, Linux, and Generative AI technologies to build scalable and intelligent applications.

DECLARATION

I hereby declare that the above information is true and correct to the best of my knowledge.
